

Keepod on your favorite operating system

Keepod goes cross-platform! With its new version the world's slimmest secure device runs now on Windows, Mac OS and Linux

Milan, 15 September 2009 – **NSEC**, Italian company manufacturer of **Keepod**, announced today the release of **version 4** of its product.

Keepod, the world's slimmest secure portable storage device, equipped with a hardware level encryption, becomes today completely **cross-platform** and can work on Windows, Mac OS and Linux platforms as well, secure and easy to use. The user's experience remains the same on all operating systems thanks to the **new user interface**, that leads to your secured data through a few simple clicks.

The new Keepod version aims to meet the enterprises' needs: ensuring protection to their assets and, at the same time, to manage them easily; the new version is ready for **centralized management** requirements, that give companies a biggest control of their own infrastructure.

Keepod has been renovated not only inside, but also outside: on the occasion of the new version launch, the card **graphical design** has been completely **renewed**, thanks to the collaboration with the brilliant Belgian-Dutch designer **Justus Bruns**, who expressed the device versatility and uniqueness in its design.

*"In NSEC we are always working to offer complete and advanced products to our customers" - declares **Nissan Bahar, CEO** of **NSEC** – "We think that the changes introduced today will make Keepod even more attractive and interesting for companies regardless of their size or field of operation. Creating a cross platform product was an important milestone for us as a vendor and a target in our 2009 roadmap: today we are glad to announce that we made it."*

The new features and functionalities improve a device that in the past was already defined as "PC that fits into your wallet" by the local Italian media (home of the Keepod). In fact, thanks to the partnership with VMware, Keepod users can **launch directly from Keepod any application** on any PC, with zero installation and zero footprint.

The combination of VMware ThinApp technology* and Keepod devices allows businesses to run their full software suites (not "lite" or alternative versions) in any location eliminating the installation and configuration related costs, application conflicts and regression testings.

Furthermore, the new Keepod platform and VMware ThinApp open new opportunities for software vendors to secure their software, to enable mobility, to protect their intellectual property and offer them an **innovative platform for distributing and deploying** their products.

Finally, Keepod was design to easily **integrate** with *data leakage prevention* systems. These systems aim to protect business information from external and internal threats: the combination with Keepod enables businesses to adopt a secure enterprise class device, protecting effectively their infrastructure from data leakage.

The new Keepod is available through the official resale channels and on the Keepod online store at **store.mykeepod.com**

* The VMware ThinApp Technology is compatible with Windows operating systems

***NSEC Srl** (www.nsec.it) - offers services and solutions for information security. Founded in 2007 with headquarters in Milan, Italy, NSEC has the experience of an international team of professionals and focuses its strategy in delivering high-end security solutions to the enterprise market.*

***KEEPOD** (www.keepod.it) - is the world's slimmest secure portable storage device. Sized as a credit card and equipped with robust enterprise class encryption, Keepod provides a complete solution for business users. Simple, Transparent, Powerful.*

With up to 16GB of secure storage Keepod stores all your files everywhere you go.
